Wireframe set: user flows and screen map

Two roles. A viewer (coach or player) reads statistics. An admin registers games and reviews detected events. Solid steps happen in the app; dashed steps happen outside it. Computer only, no mobile version.

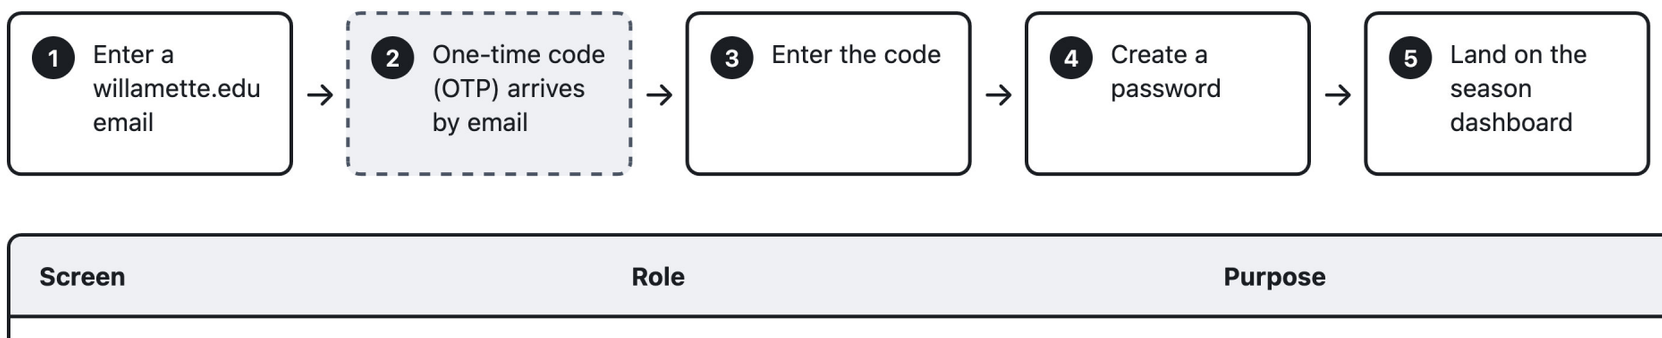

Flow A: viewer reads season statistics

Flow B: admin adds and publishes a game

Flow C: first-time access

Screen	Role	Purpose	Data read or written
1. Sign up and sign in	Everyone	Willamette email and one-time code, then a password	Supabase Auth
2. Dashboard	Viewer, admin	Season overview of counts and trends	GET /stats/goals
3. Goal positions	Viewer, admin	Where every player stood when a goal was scored	GET /stats/goal-positions
4. Game selection pane	Viewer, admin	Side pane opened from the Games filter button; chooses which games feed every statistic	GET /games
5. Add game	Admin	Register a game and its camera mode	POST /ingest/game
6. Review events	Admin	Confirm or correct detected events	PATCH /events/{id}

Forgot password? Get a new code

Design notes

- First access: a willamette.edu email, a one-time code (OTP) sent by email, then the person creates a password. After that, sign in with email and password.
- Open question: any willamette.edu address could sign up, which includes people outside the team. Options are an approved list of emails, or the admin approving each new account before it sees data.
- The admin role is granted only by the admin, never chosen during sign-up.
- After signing in, people land on the dashboard.

Season overview

The filters below apply to every page and stay set when you move between them.

Season 2026 | **Venue** Home and away | **Date range** Season start to today | **Games** ## of ## games ▸

Include panned-camera games | **Reset filters**

Showing data from ## games, ## goals scored, ## goals conceded.

Goals scored	Goals conceded	Shots	Games included
##	##	##	##
Across included games	Across included games	For and against	Of ## reviewed games

Where goals were scored from

Mini pitch with goal locations

Open goal positions

Season trend

Line chart: goals scored and conceded over time

Design notes

- Filters sit at the top and carry across Dashboard and Goals. One set of choices drives every number.
- The Games button opens a side pane for choosing which games to include.
- The status line under the filters confirms to users exactly what is included.
- Viewers only see games an admin has published, so unreviewed detections never reach the team.
- The panned-camera toggle lets coaches exclude the less accurate games and see the effect.
- The ## marks are placeholders for real values.

Away · Panned camera

[Opponent] · [date] · 78'
Home · Fixed camera

[Opponent] · [date] · 12'
Away · Fixed camera

Passes in the build-up: ##

Scorer touches before goal: ## **Stretch goal**

Design notes

- This is the screen that answers the headline question. It has two modes: one goal at a time, or every goal in the selection overlaid as a density view.
- Teams use different shapes as well as colors: circle versus triangle. Marker colors are fixed in the app and do not follow jersey colors.
- The goal list on the right chooses which goal the pitch shows.
- Scorer touches needs player-level tracking, which is marked as a stretch goal.
- Positions are always drawn with our team attacking right, matching the stored coordinate convention.

Men's Soccer Analytics | Dashboard | Goals | Account

Season overview

Season: 2026

Venue: Home and away

Games: ## of ## games ▸

Showing data from ## games, ## goals scored, ## goals conceded.

The dashboard behind the pane updates as games are ticked.
Closing the pane keeps the selection.

[date]	**[Opponent]** Fixed camera	Away	#–#
[date]	**[Opponent]** Panned camera	Home	#–#

The list scrolls. Changes apply right away.

Done

Design notes

- This pane opens from the Games button in the filter bar, on the Dashboard and on Goal positions, and it is the same list on both.
- It holds 40 to 50 games, so the list scrolls inside the pane while the search box, counts, and Done button stay in place.
- Games are grouped by season under a heading, newest first.
- Search narrows the list by opponent. Select all and Clear all apply to the games currently shown.
- Panned-camera games carry a Lower accuracy tag so coaches see why those numbers may be less certain.
- Only published games appear here, so unreviewed detections never reach viewers.
- Selection is remembered for each person between visits.
- If no games are ticked, the dashboard shows "Select at least one game" instead of empty charts.

Men's Soccer Analytics | Dashboard | Goals | **Add game** | Review events | Admin | Account

Add game

Registers a game and the settings the computer vision pipeline needs. The video itself is not uploaded here; it is processed offline.

Game details

Opponent
[Opponent name]

Date
[date]

Season
2026

Venue
Home

Camera mode

Fixed wide shot
One pitch calibration for the whole game. Highest accuracy.

Panned camera
Pitch position re-estimated throughout. Marked as lower accuracy in statistics.

Jersey colors

Our jersey today
Red

White

Opponent jersey
Orange

The pipeline separates the two teams by jersey color. The closest name is enough; an exact match is not needed.

Game status

1. **Registered**
   Next, after saving
2. **Pipeline run**
   Offline. Waiting
3. **Imported**
   Waiting
4. **Reviewed**
   Waiting
5. **Published**
   Waiting. Visible to viewers

Save game as Registered | Cancel

Design notes

- This screen is admin only. Viewers never see the Add game or Review links.
- Camera mode is chosen once per game, because a game is never part fixed and part panned. It decides which calibration path the pipeline uses.
- Jersey colors are not shown on the dashboard. They are settings for the computer vision pipeline, which separates the two teams by shirt color. Our team is red or white, so that is a two-way choice.
- Pitch calibration is not part of this screen. It is done in the offline calibration tool, before the pipeline runs.
- No video is stored in the app. Footage stays on the admin's machine, which keeps the hosted side within free limits.
- The status list shows where a game is in the process.

Men's Soccer Analytics | Dashboard | Goals | Add game | Review events | Admin | Account

Review events

[Opponent] · [date] · Fixed camera · Status: Imported

of ## events confirmed

Confirm all high-confidence events

Publish game

Publishing unlocks when every low-confidence event has been confirmed or corrected.

Events

All | Needs review | Goals

34' Goal · Our team
Confidence: Low Needs review

12' Shot · Opponent
Confidence: High Confirmed

27' Save · Our team
Confidence: Medium Needs review

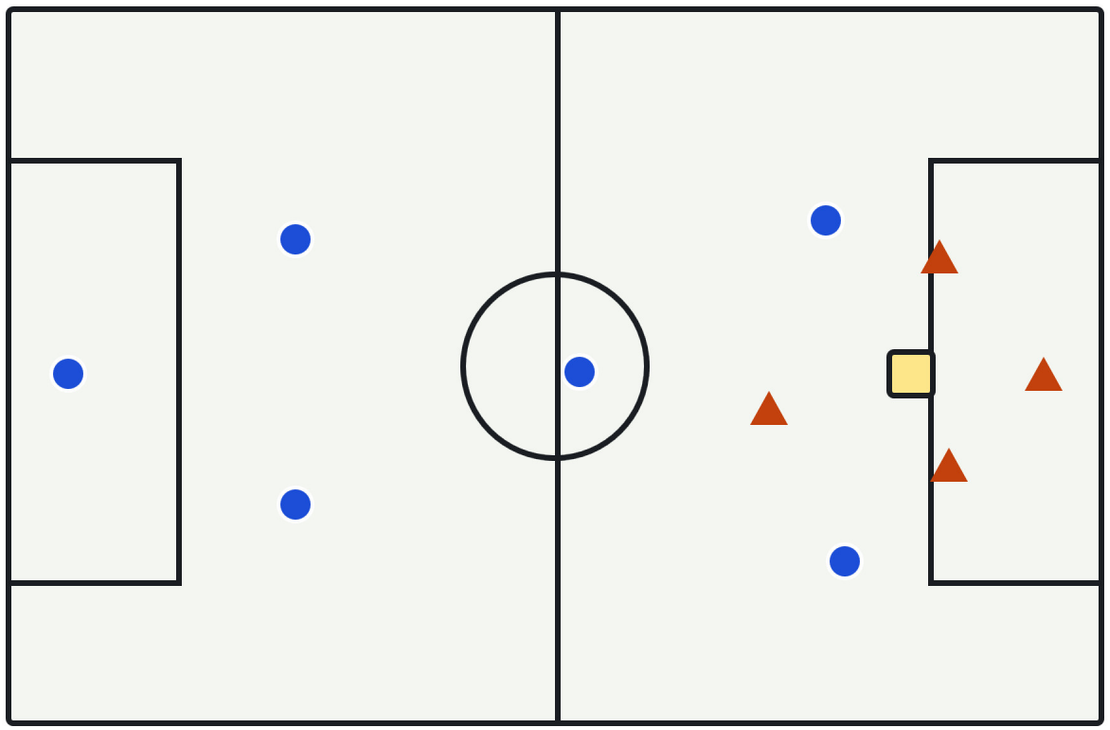

41' Corner · Our team
Confidence: High Confirmed

55' Shot · Our team
Confidence: Low Needs review

Add missing event

Goal at 34', Our team

Square marker shows the detected event position. Drag it, or use the number fields below. Circles are our team, triangles the opponent.

Event type: Goal

Team: Our team

Time in game: 34:12, set automatically

Pitch x (m): ##

Pitch y (m): ##

Detection confidence: Low

Confirm event | Save correction | Delete event

Design notes

- This step keeps wrong numbers away from coaches. Detected events start as unconfirmed and only published games reach viewers.
- Low-confidence events can be filtered to the top, so the work is only the events the pipeline is unsure about.
- Panned-camera games will have more Low items, so they take longer. Fixed-camera games should be quicker to clear.
- Positions can be corrected by dragging the marker or typing the pitch coordinates.
- High-confidence events can be confirmed all at once. Timestamps are recorded automatically.
- Add missing event covers things the pipeline did not detect.
- Publish is disabled with a visible reason, not hidden.
